

**GEOG 2180 – Geosystems, Environment, & Society** is an in-depth exploration of physical geography, the features and patterns occurring at Earth's surface and the processes—both human and natural—that give rise to them. We focus on four major subfields in physical geography: climatology, hydrology, geomorphology, and biogeography. We learn how to see, think, and communicate like a geographer: by studying the fundamental concepts of space, place, and scale; synthesizing information from diverse fields; and representing information visually.
