

**GEOG 3200 – Sustainability** is a broad concept that most people relate to reducing long-term environmental impacts through “green” initiatives. This course is an introduction to sustainability from an organizational viewpoint that is designed to help students develop skills for jobs in sustainability/environmental departments in municipalities, businesses, etc. Topics include a survey of conceptual frameworks, application of metric and standards used in sustainability projects, and research on changing actions toward sustainable behaviors. Students will also conduct small-scale research projects on campus in a specific area of sustainability (e.g., evaluating energy efficiency measures, improving recycling rates).
